

The 6D Mesh/Torus Interconnect of K Computer

Tomohiro Inoue
FUJITSU LIMITED

- Introduction

- Architecture

 - Node construction

 - Network construction

 - Routing function

- Conclusion

Interconnect of K computer

■ Tofu: Fujitsu's original 6D mesh/torus interconnect

- High communication performance
- High system scalability
- High fault-tolerance

Node construction

- Single CPU and single interconnect controller
- 10 links for inter-node connection
- 10GB/s per link
- Total 100GB/s of off-chip bandwidth
 - Feeds sufficient data to high performance CPU

Network construction

- 6 links \Rightarrow Scalable xyz 3D torus
- 4 links \Rightarrow Fixed size abc 3D mesh/torus
- $|a|=2, |b|=3, |c|=2 \Rightarrow 12$ nodes

- Total topology is 6D mesh/torus
- Cartesian product of xyz and abc mesh/torus

Network construction cont.

- From the other perspectives...

- Overlaid twelve xyz torus
- $X \times Y \times Z$ array of abc mesh/torus

- Twelve times higher scalability than the 3D torus network

Network construction cont.

- Each pair of adjacent *abc* mesh/torus is interconnected with twelve links

Routing algorithm

■ Extended dimension order routing

- Additional *abc* traversal
- *abc* \Rightarrow *xyz* \Rightarrow *abc*
- The first *abc* traversal is path selection

■ Example routing

- Routing from $(x=0, y=0, z=0, a=0, b=0, c=0)$ to $(3, 2, 1, 1, 1, 1)$
- Traverses + b , + a , + $x * 3$, + $y * 2$, + z , + c

Detouring faulty nodes

- Multipath routing allows to detour faulty nodes

- Tofu: 6D mesh/torus interconnect architecture

- High communication performance
 - 100GB/s off-chip bandwidth feeds enough data to high performance CPU

- High system scalability
 - 12x higher scalability compared with 3D torus

- High fault-tolerance
 - Multipath routing algorithm allows to detour faulty nodes
